These can be used in the production of vaccines against H. influenzae infection, which can cause outtis media in infants and children, pneumonia in elders, sinusitis, nosocomial infections, or invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, auditive nerve damage, delayed speech learning, infections of the upper respiratory tract and inflammation of the middle ear. The present sequence is a version of the BASB201 coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated non-typeable Haemophilus influenzae BASB201 polypeptides, useful as components of vaccines for treating bacterial inflection such as otitis media, delayed speech learning and inflammation of middle ear

The lppB gene fragment was taken from pMS11. The lppB can be used in vaccines for preventing or treating H. sommus infections, which cause thromboembolic meningo-encephalitis, septicaemia, arthritis and request in the large sequence.

                                                                                                                                                           In situ production of a homologous autolysin or a heterologous autolysin from a food grade Gram positive bacteria, can be used in a process for the lysis of a culture of lactic acid bacteria. The cultures of lactic acid bacteria e.g. cheese, where the culture is lysed following the completion of fermentation. The enhanced induction of the autolysin is performed some hours after the fermentation is finished. No extra lysin needs to be added and the lysin does not need to be isolated or encapsulated. The time of lysis can be precisely controlled.

inhibition activity. The proteins may be administered to patients as vaccines, and the nucleotides may be used as part of a gene therapy regime. Diseases or conditions that may be treated using the proteins or nucleotides of the invention include autoimmune diseases; genetic disorders; haemophilia; cardiovascular diseases; cancer; bacterial, fungal and viral infections, especially HIV; multiple sclerosis; rheumatoid arthritis; pulmonary inflammation; Guillain.Barre syndrome; insulin dependent diabetes mellitus; and allergic reactions such as asthma and anaemia. They may also be used for treating wounds, burns, ulcers, osteoporosis, osteoarthritis, periodontal diseases, Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis (ALS). Proteins with activiny inhibin activity may additionally may also be used for the sclerosis (ALS).
                                                                                                                                                                                                                                                                                                          cytokine activity; cell proliferation; differentiation; immune modulation; haematopoiesis regulation; tissue growth activity; activin/inhibin activity; chemotactic/chemokinetic activity; h
                                                                                                                                                                                                                                                                                                                                                       The invention relates to 40 human secreted proteins (AAY94981-Y95020), and cDNA sequences encoding them (AAA23423-A23462). The secreted proteins of the invention include those that are thought to be only partially secreted, i.e., transmembrane proteins. The proteins of the invention may exhibit one or more activities selected from the following:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New secreted or transmembrane proteins and polynucleotides encoding them, useful for treating neurodegenerative disorders, autoimmune diseases and cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted protein; cancer; tumour; cardiovascular disorder; blood disorder; haemophilia; autoimmune disease; diabetes; inflam infection; fungal; bacterial; viral; HIV; allergy; arthritis; neurodegenerative disease; asthma; contraceptive; ss.
Sequence: 4093
                                                           additionally be useful as contraceptives. Nucleic acid sequer invention may be used in chromosome mapping, and as a source

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABL50555 to ABL50562 represent contigs 1 to 8 from the Micromonospora carbonacea everninomicin biosynthetic locus gene cluster. The contigs encode the protein sequences designated ORF (open reading frame) 1 to 49, given in ABB06881 to ABB06930. The gene cluster is useful for the construction of the everninomicin antibiotic in overproducing strains, and to allow chemical modifications of everninomicin to enhance certain properties via genetic manipulation or combinational biosynthesis. The gene cluster can be used to produce genetic systems and genes encoding novel enzyme activities, and avoid the problems of low yield and quality of everninomicins produced by chemical synthesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7321
```

Streptomyces venezuelae vep ORF1 (AAT68715) comprises the polyketide synthase (PKS) gene cluster encoding a polyene of 12 carbons (see also AAM16829-30 and AAW00918). It contains 5 PKS modules, with a 5' loading module and a 3' end domain. Each of the sequenced modules includes a keto-ACP, an acyltransferase, a dehydratase, a keto-reductase and an acyl carrier protein domain. He gene cluster was cloned using a heterologous hybridisation strategy from a genomic DNA library. A novel expression cassette encoding the first module

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not cerived from the eryC gene cluster of Saccharopolyspora erythraea or CC Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide compounds. Recombinant or augmented cells comprising the desosamine CC compounds. Recombinant or augmented cells comprising the desosamine CC compounds. Recombinant or augmented cells comprising the desosamine CC and/or macrolide biosynthetic gene clusters are useful for the corolides. The macrolide biosynthetic gene clusters are useful for the compounds are useful for synthesis of methymycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide cynthesis may be useful to prepare novel antibiotics and cc synthesis may be useful to prepare novel antibiotics and cc recombinant host cells are useful as biopolymers, e.g., in packaging or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Desosamine and macrolide biosynthetic synthesis of methymycin and pikromycin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Desosamine biosynthesis; macrolide; polyketide; methymycin; pikr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents a Streptomyces venezuelae ATCC 15439 DNA sequence, designated vep ORF 1 in the specification, which actually contains 3 open reading frames, which encode proteins AAY7717-Y77178 and monomer synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15872 BP;

                                                                                                                                                                                                                                                                       The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB5300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent w0200177334 (published 18-OCT-2001) which is available in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37RV (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=6294328B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Evaluating strain variation of Mycobacterium tuberculosis, comprise determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and 137Rv (AAI99682). The method is useful for evaluating strain variation M. tuberculosis and has valuable application in the fields of M. tuberculosis genetics, epidemiology, patient treatment and epidemic monitoring.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   monitoring.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.html?DocID=6294328B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of several versions of the BASB201 protein from non-typeable Haemophilus influenzae. These can be used in the production of vaccines against H. influenzae infection, which can cause otitis media in infants and children, pneumonia in elders, simusits, nosocomial infections, or invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, auditive nerve damage, delayed speech
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated non-typeable Haemophilus influenzae BASB201 polypeptides, useful as components of vaccines for treating bacterial infection such as otitis media, delayed speech learning and inflammation of middle ea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         No.:

                                                                                                                                                                                                                                                                                                                                                                                                                                            29-DEC-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WO9967381-A1
                                                                                 The present sequence is a Achromobacter lyticus DNA encoding the present sequence is used in the production of altered genes which The present sequence is used in the production of altered genes which The present sequence is used in the production of altered genes which allow expression and preferably secretion of active protein in mammalian cells/tissues. The altered gene is produced by operably linking the beta-lytic protease coding sequence with mammalian promoter, signal beta-lytic protease coding sequence with mammalian promoter, signal beta-lytic protease to translation initiation sequences. The modified sequence peptide and translation initiation sequences. The modified sequence ruminants, e.g. goats, sheep, and cows. It is also used to produce transgenic animals which are resistant to staphylococcal infections.

                                                                                                                                                                                                                                                           AAX20248 to AAX20402 represent polynucleotide sequences isolated from Borrelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Borrelia burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease

Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated Borrelia burgdorferi nucleic acids - used to products for the detection, diagnosis, characterisation, and therapy of infections, particularly Lyme disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                       Peptidase was purified from Achromobacter lyticus by a Sepharose CL-4B column, a Sephadex G-75 column, and by reverse phase HPLC. The first 25 N-terminal amino acids were found to be identical to those of the beta-lytic protease from Lysobacter enzymogenes. The beta-lytic protease from Lysobacter enzymogenes. The beta-lytic protease of A. lyticus was cloned using PCR primers full length sequence of the L. enzymogenes beta-protease. The full length sequence of the gene encoding the A. lyticus enzyme was determined by dideoxy sequencing. The beta-lytic protease is expected to be an enzyme which can decompose not only Gram-positive See also AAQ25084-6.

                                                                                                                                                                             Alignment Scores:
                                                                                                                                                                                                                                                             The invention provides a method for detecting a US (sub)type hepatitis E virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in usual hybridisation and amplification assays for detecting infection. The present sequence represents a HEV-US2 full length gene sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis E virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HEV-US2 full length

PARTENT INFORMATION:

APPLICANT: Potter, Andrew A.

APPLICANT: Schryvers, Anthony B.

APPLICANT: Schryvers, Anthony B.

TITLE OF INVENTION: CLONING AND EXPRESSION OF HAEMOPHILUS SOMNUS

TITLE OF INVENTION: TRANSFERRIN-BINDING PROTEINS

FILE REFERENCE: 9000-0049-2.0

CURRENT APPLICATION NUMBER: US/09/405,728

CURRENT FILING DATE: 1999-09-24

EARLIER APPLICATION UNMEER: US 09/267,749

RARLIER APPLICATION UNMEER: US 09/267,749

EARLIER FILING DATE: 1999-03-10

NUMBER OF SEQ ID NOS: 5

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 4

LENGTH: 2179

Sequence 1, Application US/09105537A
; Patent No. 6265202
; GENERAL INFORMATION:
; APPLICANT: Sherman, D.H.
; APPLICANT: Sherman, D.H.
; APPLICANT: Xue, Y.
; APPLICANT: Zhao, L.
; TITLE OF INVENTION: DNA encoding methymycin and FILE REFERENCE: 600.438US1
; CURRENT APPLICATION NUMBER: US/09/105,537A
; CURRENT APPLICATION NUMBER: 05/09/105,537A
; CURRENT FAILING DATE: 1998-06-26
; NUMBER OF SEQ ID NOS: 43
; SOFTWARE: FASTSEQ for Windows Version 3.0
; SEQ ID NO 1
; SEQ ID NO 1
; LENGTH: 15872
; TYPE: DNA | ORGANISM: Streptomyces venezuelae
